K-Means

Jimena Isaura Medina Padilla

6/3/2022

1.-Cargar la matriz de datos.

```
X<-as.data.frame(state.x77)
```

Transformación de datos

1.- Transformación de las variables x1,x3 y x8 con la función de logaritmo.

```
X[,1]<-log(X[,1])
colnames(X)[1]<-"Log-Population"

X[,3]<-log(X[,3])
colnames(X)[3]<-"Log-Illiteracy"

X[,8]<-log(X[,8])
colnames(X)[8]<-"Log-Area"
```

Metodo k-means

1.- Separacion de filas y columnas.

```
dim(X)
```

```
## [1] 50  8
```

```
n<-dim(X)[1]
p<-dim(X[2])
```

2.-Estandarización univariante.

```
X.s<-scale(X)
```

3.- Algoritmo k-medias (3 grupos) cantidad de subconjuntos aleatorios que se escogen para realizar los calculos de algoritmo.

```r
Kmeans.3<-kmeans(X.s, 3, nstart=25)
```

Centroides

```r
Kmeans.3$centers
```

```
##   Log-Population     Income Log-Illiteracy   Life Exp      Murder    HS Grad

```

4.- SCDG

```r
SCDG<-sum(Kmeans.3$withinss)
SCDG
```

```
## [1] 203.2068
```

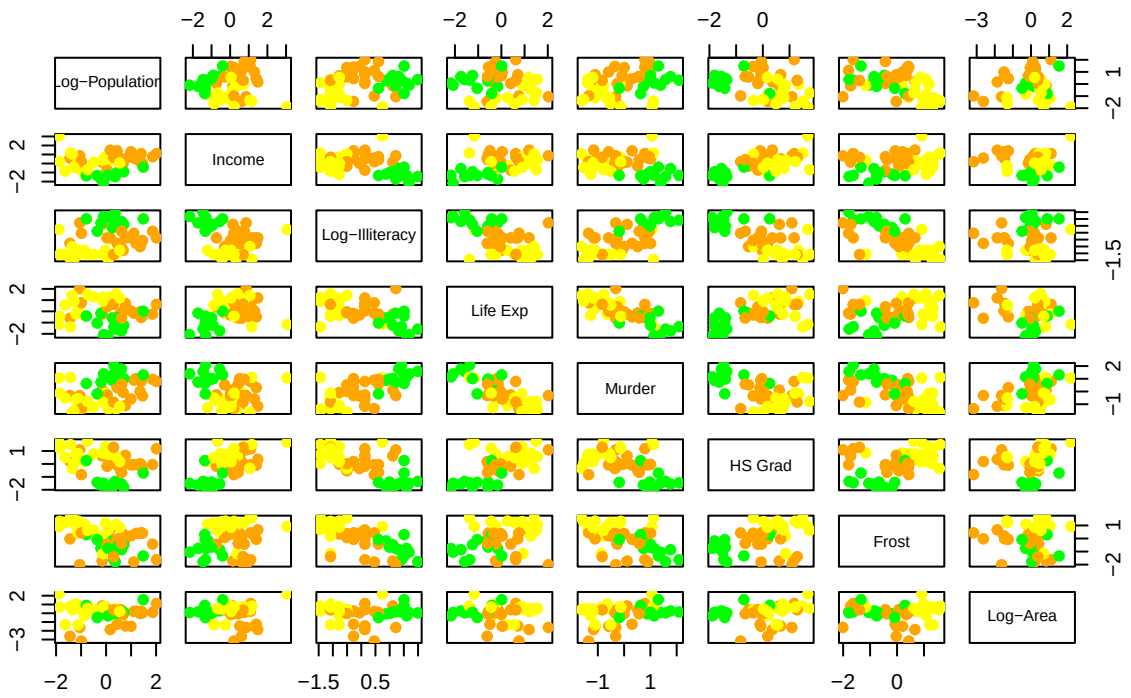
5.- Clusters

```
cl.kmeans<-Kmeans.3$cluster
cl.kmeans
```

```
##        Alabama         Alaska        Arizona       Arkansas     California
##              3              1              2              3              2
##       Colorado    Connecticut       Delaware        Florida        Georgia
##              1              2              2              2              3
##         Hawaii          Idaho       Illinois        Indiana           Iowa
##              2              1              2              2              1
##         Kansas       Kentucky      Louisiana          Maine       Maryland
##              1              3              3              1              2
##  Massachusetts       Michigan      Minnesota    Mississippi       Missouri
##              2              2              1              3              2
##        Montana       Nebraska         Nevada  New Hampshire     New Jersey
##              1              1              1              1              2
##     New Mexico       New York North Carolina   North Dakota           Ohio
##              3              2              3              1              2
##       Oklahoma         Oregon   Pennsylvania   Rhode Island South Carolina
##              2              1              2              2              3
##   South Dakota      Tennessee          Texas           Utah        Vermont
##              1              3              3              1              1
##       Virginia     Washington  West Virginia      Wisconsin        Wyoming
##              2              2              3              1              1
```

6.- Scatter plot con la division de grupos obtenidos (se utiliza la matriz de datos centrados).

```
col.cluster<-c("yellow", "orange", "green")[cl.kmeans]
pairs(X.s, col=col.cluster, main="k-means", pch=19)
```

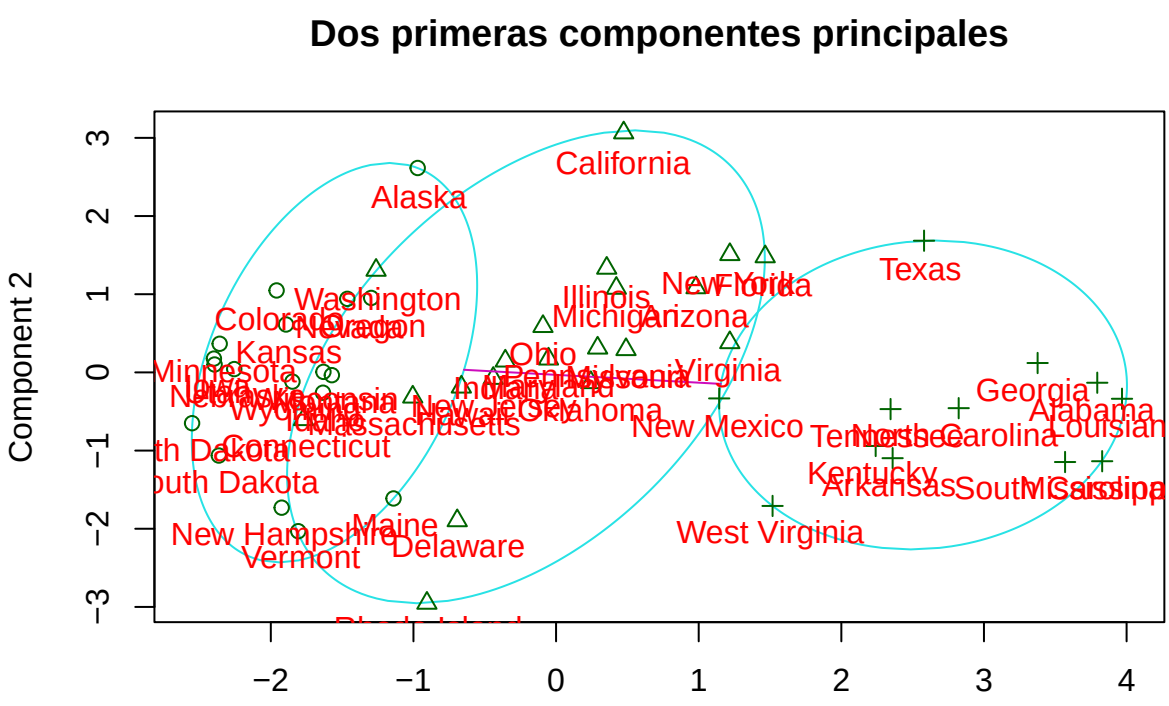


Visualización con las dos componentes principales

```
library(cluster)

clusplot(X.s, cl.kmeans,
         main="Dos primeras componentes principales")

text(princomp(X.s)$score[,1:2],
     labels=rownames(X.s), pos=1, col="red")
```



These two components explain 62.5 % of the point variability.

Silhouette

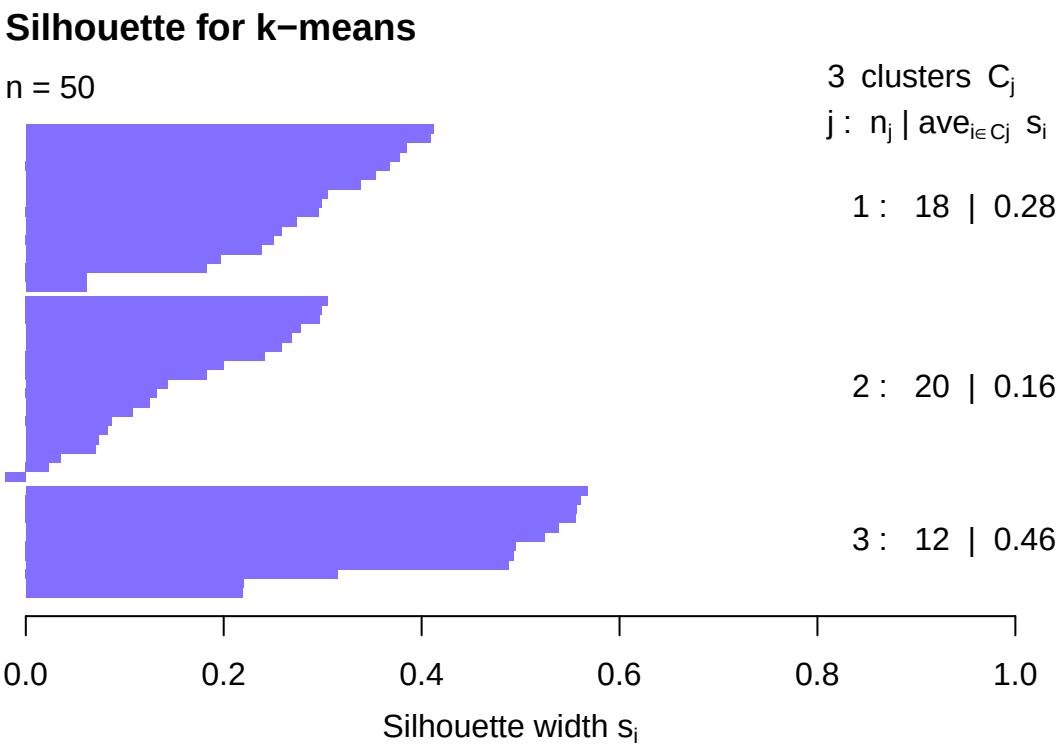
Representación grafica de la eficacia de clasificación de una observacion dentro de un grupo.

1.- Generación de los calculos

```
dist.Euc<-dist(X.s, method = "euclidean")
Sil.kmeans<-silhouette(cl.kmeans, dist.Euc)
```

2.- Generación del gráfico

```
plot(Sil.kmeans, main="Silhouette for k-means",
col="slateblue1")
```



Average silhouette width : 0.28
